

A PROJECT REPORT ON “COLLEGE WEB PORTAL”

(Live Project) Project Link: - <https://cibadress.com/app/>

**Submitted in partial fulfillment of the requirement
for the award of the degree
Bachelor of Computer Applications (BCA)**

SESSION : 2021 - 2024

Project Guided By:	Submitted By:
MR. Mukesh Kumar Ahuja (Internal Guide)	Name of Student : Aditya Koshta Enrollment No. : AX149027013 Roll No. : Study Institute code No. : 9027

Submitted to

**Makhanlal ChaturvediNational University of Journalism and
Communication, Bhopal**

**ACADEMY OF COMPUTER SCIENCE AND TECHNOLOGY,
Jabalpur (M.P.)**

ACADEMY OF COMPUTER SCIENCE AND TECHNOLOGY, Jabalpur (M.P.)

PROJECT CERTIFICATE

This is to certify that the project report entitled **COLLEGE WEB PORTAL** submitted to Makhanlal Chaturvedi National University of Journalism & Communication, in partial fulfillment of the requirement for the award of the degree of Bachelor of Computer Applications (BCA), is original work carried out by myself Mr. Aditya Koshta with Enrollment no. AX149027013 under the Supervision of Mr. **Mukesh Kumar Ahuja**. The matter embodied in this project is genuine work done by myself and has not been submitted whether to this University or to any other University / Institute for the fulfillment of the requirement of any course of study.

ACKNOWLEDGEMENT

This Major Project is the result of contribution of many minds. I would like to acknowledge and thank my project guide **Mr. Mukesh Kumar Ahuja** for his valuable support and guidance. He guided me through the process from conception and till the completion of this project. I would also like to thanks my class institute director **Dr. Prashant Karmveer** and my all my faculties of ACST, Jabalpur. I thank to lab staff members **Ms. Roopali Mam'm** and other non-teaching members.

I am very thankful for the open-handed support extended by many people. While no list would be complete, it is my pleasure to acknowledge the assistance of my friends who provided encouragement, knowledge and constructive suggestions.

Signature of Student
(Aditya Koshta)
(Roll No. _____)
(Enrollment: AX149027013)

SELF-CERTIFICATE

This is to certify that the Major Project report entitled **“COLLEGE WEB PORTAL”** is done by me, and it is authentic work carried out for the partial fulfillment of the requirements for the award of the degree of Bachelor of Computer Applications (BCA) under the guidance of **Mr. Mukesh Kumar Ahuja**. The matter and software embodies in this project has not been submitted earlier for award of any degree or diploma to the best of my knowledge and believes.

Signature of Student
(Aditya Koshta)
(Roll No. _____)
(Enrollment: AX149027013)

CERTIFICATE FROM PROJECT GUIDE

This is certified that this Major Project entitled “**COLLEGE WEB PORTAL**” submitted in partial fulfillment of the requirements for the award of the degree of Bachelor of Computer Applications (BCA) in session (years 2021 to 2024) to the Makhanlal Chaturvedi National University of Journalism & Communication, Bhopal, done by **Mr. Aditya Koshta** is an authentic work carried out by them at “**Academy of Computer Science And Technology, Jabalpur**” under my guidance.

The matter and software embodied in this project work has not been submitted earlier for the award of any degree or diploma to the best of my knowledge and belief.

Signature of BCA Teacher
Mr. Mukesh Kumar Ahuja

Chapter 1: Introduction of the Project

(i) Objective to the Project

The primary objective of the Project College Web Portal is to create an integrated, user-friendly, and secure online platform that facilitates seamless communication, efficient management, and enhanced accessibility of college-related information and services for students, faculty, and administrative staff. This web portal aims to be a comprehensive digital hub, addressing the diverse needs of its users and promoting a more connected and informed college community.

- **Enhancing Communication and Collaboration:** The web portal will provide a centralized platform for students, faculty, and staff to communicate effectively.
- **Streamlining Administrative Processes:** One of the key objectives is to automate and simplify administrative tasks. The portal will offer online registration, grade submission, fee payment, and scheduling systems.
- **Improving Accessibility of Information:** The portal will act as a repository for all essential information related to courses, events, academic calendars, and policies. Students and faculty will have 24/7 access to up-to-date information, ensuring that they are always well-informed and can plan accordingly.
- **Supporting Academic Success:** By providing resources such as digital libraries, lecture notes, and academic support services, the web portal will support students in their academic endeavors.
- **Enhancing User Experience:** A user-friendly interface will encourage more frequent use and help users to navigate the portal efficiently without requiring extensive technical knowledge.
- **Ensuring Data Security and Privacy:** The portal will incorporate robust security measures to protect sensitive user data. Ensuring the confidentiality, integrity, and availability of data is paramount. The portal will comply with relevant regulations and best practices in data security and privacy.
- **Fostering Community Engagement:** The portal will feature tools for organizing and promoting extracurricular activities, clubs, and events.
- **Facilitating Feedback and Continuous Improvement:** The portal will include mechanisms for collecting user feedback, which will be used to continuously improve its features and functionality.

This project includes following modules:

Domain

Hosting

Authorization

Publishing a Notification, Result, Photos, Information

Publishing Teacher Info, Management Info

Admin Center

Content Management

User Management

(ii)Problem Definition

The College Web Portal website's motto is: **“Connecting, Empowering, and Enhancing College Life.”** "Connecting" signifies the portal's role in bridging the communication gap among students, faculty, and administrative staff, fostering a more cohesive and collaborative community. "Empowering" highlights the portal's aim to provide users with the tools and resources they need to take control of their academic and administrative tasks, promoting self-sufficiency and informed decision-making. "Enhancing College Life" reflects the portal's broader objective to enrich the overall college experience by simplifying processes, providing easy access to information, and supporting extracurricular activities, thereby making college life more engaging and manageable.

The goal of a College Web Portal's website is to serve as a comprehensive digital hub that enhances the academic and administrative experience for students, faculty, and staff. By providing a centralized platform for communication, resource access, and process management, the portal aims to streamline daily operations, foster collaboration, and improve overall efficiency within the college community.

1. User Authentication and Profiles:

- Secure login system for students, faculty, and staff.
- Personalized profiles displaying relevant information and updates.

2. Course Management:

- Course registration and enrollment.
- Access to course syllabi, lecture notes, and other materials.
- Submission and grading of assignments and exams.

3. Academic Resources:

- Digital library with access to e-books, journals, and research papers.
- Online lectures, tutorials, and supplementary learning resources.
- Academic advising and tutoring services.

4. Communication Tools:

- Internal messaging system for direct communication between users.
- Discussion forums and chat rooms for academic and social interactions.
- Announcement boards for campus news, events, and updates.

5. Administrative Services:

- Online fee payment and financial aid management.
- Scheduling and timetable management.
- Grade reporting and transcript requests.

6. Event Management:

- Calendar of campus events, workshops, and extracurricular activities.
- Event registration and ticketing.
- Notifications and reminders for upcoming events.

7. Community Building:

- Platforms for student clubs, organizations, and interest groups.
- Tools for organizing and promoting activities and meetings.
- Social networking features to connect with peers and faculty.

8. Feedback and Support:

- Mechanisms for collecting user feedback on portal functionality and content.
- Helpdesk and technical support services.
- Frequently Asked Questions (FAQ) section and user guides.

9. Personalized Dashboard:

- Customizable dashboard displaying relevant information such as class schedules, deadlines, and notifications.
- Quick links to frequently used services and resources.

10. Mobile Accessibility:

- Responsive design for use on smartphones and tablets.
- Mobile apps for enhanced accessibility and convenience.

11. Security and Privacy:

- Data encryption and secure protocols to protect user information.
- Privacy settings to control visibility of personal information.

12. Analytics and Reporting:

- Tools for tracking academic performance and attendance.
- Reports and analytics for administrators to monitor portal usage and effectiveness.

FEASIBILITY STUDY

This study examines the feasibility of creating a website to showcase a College Web Portal's portfolio and services. The analysis suggests that a web portal is a highly viable solution with significant benefits for establishing a professional online presence and attracting users.

- **Increase visibility:** Reach a wider audience of students, faculty, and staff searching for academic resources and services online.
- **Showcase expertise:** Demonstrate the College Web Portal's capabilities, resources, and unique features through detailed portfolios, galleries, and user testimonials.
- **Facilitate User Interaction:** Provide intuitive navigation and user-friendly interfaces to ensure ease of use for all visitors.
- **Build brand identity:** Create a visually compelling and professional web portal that reflects the college's unique style, personality, and brand.
- Technical feasibility
- Economical feasibility
- Operational feasibility

Technical feasibility

The Proposed system is developed by **Server Language PHP 5.5** [XAMPP server]

Language Used

1. **Front End (User Interface) HTML 5, CSS, JAVASCRIPT, BOOTSTRAP**
2. **Server Language PHP 5.5**
3. **Backend MYSQL**

Economical feasibility

The economic feasibility of developing a College Web Portal is highly favorable, given the considerable long-term benefits and cost savings associated with its implementation. Initially, the project requires a significant investment in terms of development, hardware, software, and training. However, these upfront costs are offset by the substantial efficiencies and savings the portal will generate over time. Automating administrative tasks, such as course registration, fee payments, and grade submissions, reduces the need for extensive manual labor, resulting in lower operational costs and freeing up staff to focus on more strategic activities.

Operational feasibility

The operational feasibility of a College Web Portal is promising, given the advancements in technology and the growing familiarity of digital tools among students, faculty, and staff. Implementing such a portal requires a comprehensive strategy that includes robust infrastructure, skilled personnel, and user-friendly design. The college's existing IT infrastructure, with necessary upgrades, can support the portal's functionalities, ensuring reliability and accessibility. Training sessions for users will be crucial to ensure smooth adoption and effective utilization of the portal's features.

PROJECT PLANNING & SCHEDULE

System Actors (Users)

- Admin
- Registered Users
- Guest Users

Admin Features

- Admin login
- Admin can add new post details
- Admin can manage event details (edit, delete)
- Admin can manage staff details (edit, delete)
- Admin can add new user details
- Admin can manage user details (edit, delete)
- Admin can check all registered users' details
- Admin can change password
- Admin dashboard

Registered User Features

- New User can Registered by Admin User.
- Registered User can login with valid username and password
- User Can Recover Forget password through Administration
- User can find Staff details and get useful information
- User can View Publish Information
- User Can Update their Username
- User Can Update their Password
- Logout

Guest User Features

- Guest user can view the website and Surfe/Find Post details

There should be a Web App version for the software to connect with for those who wish for a quick dj servicer. The Web App will be responsive to any device using it.

This allows for event organizer to access the service from any sort of hardware device: tablet, computer, mobile devices, and so on. The software itself will be available on all computer platforms that are running any aspect of Linux, Windows 7, Windows 8, and Mac operating systems.

The software will also be easily available to Windows 10 when it comes out later in the year. Besides, computers, the software has a minimal version for tablets for those working for the company to easily navigate through post when they are on the learning phase or simply away from the computer.

Chapter 2: Database Design & Flow Chart

Figure 1

HARDWARE & SOFTWARE SPECIFICATION

The software should be ran on any sort of desktop or laptop environment, regardless of the operating system. The software also has the potential of running on tablets, but with a more simplified version. Essential input/output devices are keyboards, mouse, and printers; nothing else is required but can be recommended if desired.

Website Interface - Primary Tasks:

- View all available Education Content
 - Connects with the database through PHP to call all Post objects and display them accordingly
- Search for desired Content by title, Author, and Category
 - A search box will be implemented on the website that will search the site based on the input
- Select their desired Content
 - A button will be displayed under the Post Description that will allow for the read more about it
- Allow for registration
- Allow the User to log in
 - log in display form

Company-side Software - Primary Tasks:

- Allow company workers to open and view student information
 - navigation option that will allow for search of student by name
 - implementation of search bar

Primary storage :

Size : 20.1 MB

Size on disks: 20.5 MB

Contained file:228 files ,20 folders

Performance Requirements:

- Ability to maintain mass amount of customers on the website at once without crashing
- Speedy performance / transmission of data
- Have a quick recovery time if anything were to go wrong
- Display accurately and efficiently on all devices (responsive view)

Security Requirements:

- Secure any transmissions of private information between the student and the institute
- Prevent any potential threats such as SQL injections through the forms or search boxes.

- Prevent third party users at administration level
- Verify website security certificates (that lock in the address bar)

Quality Attributes:

- Maintain a user friendly environment that is visually appealing
- Easy to see and use navigation
- Maintain readable content
- Searching Content should be accessible to people who are and are not logged in

Software Requirements

- XAMPP server
- Language Used
 1. Front End(User Interface) HTML 5, JAVASCRIPT, BOOTSTRAP
 2. Server Language PHP 5.5
 3. Back end MYSQL

Chapter 3: Development tools & Technology

Development tools specification

Windows 10 (Operating System)

Microsoft Windows is a GUI (Graphical User Interface) multitasking operating system, that is in its environment user can perform a lots of job in a very short span of time where as in case of other environments this it is not possible. If a user has to work with more then one software then one or the other must be closed so that another can be taken into use. Along with this due to the GUI nature of WINDOWS user need not to look for each and every command that has to be supplied to the machine each and every thing is available to the user in front of its eyes in form of big/small picture or text material.

Welcome to Windows 10 Professional. Among the new features available in Windows 10, there are new security tools that you can use to help keep your computer more secure, and new technologies that run in the background, making your computer run more efficiently and reliably.

Windows 10 has improved upon security, including the new Security Center, which allows you to check the status of the important security elements on your computer—Windows Firewall, Automatic Updates, and virus protection software—making it easier for you to understand how to keep your computer better protected against viruses and other security threats. Performance is at an all-time high. You can now use more programs at the same time and they will run faster than ever. Windows 10 is dependable and stable, so you can always rely on the performance and effectiveness of your computer.

Improvements have also been made on many features that make using your computer more effective and useful. For example, you can use Remote Desktop to access your work computer and its resources from home, and to view files and documents on your computer's desktop from a co-worker's computer. With NetMeeting you can have virtual meetings with anyone, anywhere, and you can participate in discussions using audio, video, or chat. Getting help has never been easier. With Remote Assistance, you just send an invitation (either in e-mail or Instant Messenger) to your favorite computer expert or support professional, and they can help you fix a problem from their location. Windows 10 provides extensive online Help for all operating system features, as well as a digital tour to help you discover the possibilities awaiting you.

XAMPP SERVER

XAMPP is one of the widely used cross-platform web servers, which helps developers to create and test their programs on a local webserver. It was developed by the Apache Friends, and its native source code can be revised or modified by the audience. It consists of Apache HTTP Server, MariaDB, and interpreter for the different programming languages like PHP and Perl. It is available in 11 languages and supported by different platforms such as the IA-32 package of Windows & x64 package of macOS and Linux.

What is XAMPP?

XAMPP is an abbreviation where X stands for Cross-Platform, A stands for Apache, M stands for MYSQL, and the Ps stand for PHP and Perl, respectively. It is an open-source package of web solutions that includes Apache distribution for many servers and command-line executables along with modules such as Apache server, MariaDB, PHP, and Perl.

XAMPP helps a local host or server to test its website and clients via computers and laptops before releasing it to the main server. It is a platform that furnishes a suitable environment to test and verify the working of projects based on Apache, Perl, MySQL database, and PHP through the system of the host itself. Among these technologies, Perl is a programming language used for web development, PHP is a backend scripting language, and MariaDB is the most vividly used database developed by MySQL. The detailed description of these components is given below.

Components of XAMPP

As defined earlier, XAMPP is used to symbolize the classification of solutions for different technologies. It provides a base for testing of projects based on different technologies through a personal server. XAMPP is an abbreviated form of each alphabet representing each of its major components. This collection of software contains a web server named Apache, a database management system named MariaDB and scripting/programming languages such as PHP and Perl. X denotes Cross-platform, which means that it can work on different platforms such as Windows, Linux, and macOS. Many other components are also part of this collection of software and are explained below.

1. **Cross-Platform:** Different local systems have different configurations of operating systems installed in it. The component of cross-platform has been included to increase the utility and audience for this package of Apache distributions. It supports various platforms such as packages of Windows, Linus, and MAC OS.
2. **Apache:** It is an HTTP a cross-platform web server. It is used worldwide for delivering web content. The server application has made free for installation and used for the community of developers under

the aegis of Apache Software Foundation. The remote server of Apache delivers the requested files, images, and other documents to the user.

3. **MariaDB:** Originally, MySQL DBMS was a part of XAMPP, but now it has been replaced by MariaDB. It is one of the most widely used relational DBMS, developed by MySQL. It offers online services of data storage, manipulation, retrieval, arrangement, and deletion.
4. **PHP:** It is the backend scripting language primarily used for web development. PHP allows users to create dynamic websites and applications. It can be installed on every platform and supports a variety of database management systems. It was implemented using C language. PHP stands for **Hypertext Processor**. It is said to be derived from Personal Home Page tools, which explains its simplicity and functionality.
5. **Perl:** It is a combination of two high-level dynamic languages, namely Perl 5 and Perl 6. Perl can be applied for finding solutions for problems based on system administration, web development, and networking. Perl allows its users to program dynamic web applications. It is very flexible and robust.
6. **phpMyAdmin:** It is a tool used for dealing with MariaDB. Its version 4.0.4 is currently being used in XAMPP. Administration of DBMS is its main role.
7. **OpenSSL:** It is the open-source implementation of the Secure Socket Layer Protocol and Transport Layer Protocol. Presently version 0.9.8 is a part of XAMPP.
8. **XAMPP Control Panel:** It is a panel that helps to operate and regulate upon other components of the XAMPP. Version 3.2.1 is the most recent update. A detailed description of the control panel will be done in the next section of the tutorial.
9. **Webalizer:** It is a Web Analytics software solution used for User logs and provide details about the usage.
10. **Mercury:** It is a mail transport system, and its latest version is 4.62. It is a mail server, which helps to manage the mails across the web.
11. **Tomcat:** Version 7.0.42 is currently being used in XAMPP. It is a servlet based on JAVA to provide JAVA functionalities.
12. **Filezilla:** It is a File Transfer Protocol Server, which supports and eases the transfer operations performed on files. Its recently updated version is 0.9.41.

XAMPP Format Support

XAMPP is supported in three file formats:

- **.EXE-** It is an extension used to denote executable files making it accessible to install because an executable file can run on a computer as any normal program.

VISUAL STUDIO CODE

Visual Studio Code is a code editor in layman's terms. Visual Studio Code is "a free-editor that helps the programmer write code, helps in debugging and corrects the code using the intelli-sense method ". In normal terms, it facilitates users to write the code in an easy manner. Many people say that it is half of an IDE and an editor, but the decision is up to the coders. Any program/software that we see or use works on the code that runs in the background. Traditionally coding was used to do in the traditional editors or even in the basic editors like notepad! These editors used to provide basic support to the coders.

Some of them were so basic that it was very difficult in writing basic English level programs in them. As time went by, some programming languages needed a specific framework and support for further coding and development it, which was not possible using these editors. VI Editor, Sublime Text Editor, is one of the many kinds of editors that came into existence. The most prominent and which supports almost every coding language is VISUAL STUDIO CODE. Its features let the user modify the editor as per the usage, which means the user is able to download the libraries from the internet and integrate it with the code as per his requirements.

Visual Studio Code has some very unique features. They are listed as below :

- **Support for multiple programming languages:** Supports multiple programming languages. So earlier, programmers needed Web-Support: a different editor for different languages, but it has built-in multi-language support. This also means it easily detects if there's any fault or cross-language reference, it'll be able to detect it easily.
- **Intelli-Sense:** It can detect if any snippet of code is left incomplete. Also, common variable syntaxes and variable declarations are made automatically. Ex: If a certain variable is being used in the program and the user has forgotten to declare, intelli-sense will declare it for the user.
- **Cross-Platform Support:** Traditionally, editors used to support either Windows or Linux or Mac Systems. But Visual Studio Code is cross-platform. So it can work on all three platforms. Also, the code works on all three platforms; else, the open-source and proprietary software codes used to be different.
- **Extensions and Support:** Usually supports all the programming languages but, if the user/programmer wants to use the programming language which is not supported then, he can download the extension and use it. And performance-wise, the extension doesn't slow down the editor as it runs as a different process.
- **Repository:** With the ever-increasing demand for the code, secure and timely storage is equally important. It is connected with Git or can be connected with any other repository for pulling or saving the instances.

- **Web-Support:** Comes with built-in support for Web applications. So web applications can be built and supported in VSC.
- **Hierarchy Structure:** The code files are located in files and folders. The required code files also have some files, which may be required for other complex projects. These files can be deleted as per convenience.
- **Improving Code:** Some code snippets can be declared a bit differently, which might help the user in the code. This function prompts the user, wherever necessary, to change it to the suggested option.
- **Terminal Support:** Many of the times, the user needs to start from the root of the directory to start with a particular action, in-built terminal or console provides user support to not to switch in-between two screens for the same.
- **Multi-Projects:** Multiple projects containing multiple files/folders can be opened simultaneously. These projects/folders might or might not be related to each other.
- **Git Support:** Resources can be pulled from Git Hub Repo online and vice-versa; saving can be done too. Resource pulling also means cloning the code which is made available on the internet. This code can later be changed and saved.
- **Commenting:** A common feature, but some of the languages do not support it. Commenting on the code helps the user to recall or track according to the sequence he wants.

Introduction to PHP

What is a PHP File?

- PHP files can contain text, HTML, CSS, JavaScript, and PHP code
- PHP code is executed on the server, and the result is returned to the browser as plain HTML
- PHP files have extension ".php"

What Can PHP Do?

- PHP can generate dynamic page content
- PHP can create, open, read, write, delete, and close files on the server
- PHP can collect form data
- PHP can send and receive cookies
- PHP can add, delete, modify data in your database
- PHP can be used to control user-access
- PHP can encrypt data

With PHP you are not limited to output HTML. You can output images or PDF files. You can also output any text, such as XHTML and XML.

Why PHP?

- PHP runs on various platforms (Windows, Linux, Unix, Mac OS X, etc.)
- PHP is compatible with almost all servers used today (Apache, IIS, etc.)
- PHP supports a wide range of databases
- PHP is free. Download it from the official PHP resource: www.php.net
- PHP is easy to learn and runs efficiently on the server side

What's new in PHP 7

- PHP 7 is much faster than the previous popular stable release (PHP 5.6)
- PHP 7 has improved Error Handling
- PHP 7 supports stricter Type Declarations for function arguments
- PHP 7 supports new operators (like the spaceship operator: `<=>`)

What Do I Need?

To start using PHP, you can:

- Find a web host with PHP and MySQL support
- Install a web server on your own PC, and then install PHP and MySQL

Use a Web Host With PHP Support

If your server has activated support for PHP you do not need to do anything.

Just create some .php files, place them in your web directory, and the server will automatically parse them for you.

You do not need to compile anything or install any extra tools.

Because PHP is free, most web hosts offer PHP support.

Set Up PHP on Your Own PC

However, if your server does not support PHP, you must:

- install a web server
- install PHP
- install a database, such as MySQL

Introduction to HTML

HTML is an acronym which stands for Hyper Text Markup Language which is used for creating web pages and web applications. Let's see what is meant by Hypertext Markup Language, and Web page.

Hyper Text: HyperText simply means "Text within Text." A text has a link within it, is a hypertext. Whenever you click on a link which brings you to a new webpage, you have clicked on a hypertext. HyperText is a way to link two or more web pages (HTML documents) with each other.

Markup language: A markup language is a computer language that is used to apply layout and formatting conventions to a text document. Markup language makes text more interactive and dynamic. It can turn text into images, tables, links, etc.

Web Page: A web page is a document which is commonly written in HTML and translated by a web browser. A web page can be identified by entering an URL. A Web page can be of the static or dynamic type. With the help of HTML only, we can create static web pages.

Hence, HTML is a markup language which is used for creating attractive web pages with the help of styling, and which looks in a nice format on a web browser. An HTML document is made of many HTML tags and each HTML tag contains different content. Let's see a simple example of HTML.

```
<!DOCTYPE>
<html>
<head>
<title>Web page title</title>
</head>
<body>
<h1>Write Your First Heading</h1>
<p>Write Your First Paragraph.</p>
</body>
</html>
```

Description of HTML Example

<!DOCTYPE>: It defines the document type or it instruct the browser about the version of HTML.

<html >: This tag informs the browser that it is an HTML document. Text between html tag describes the web document. It is a container for all other elements of HTML except <!DOCTYPE>

<head>: It should be the first element inside the <html> element, which contains the metadata (information about the document). It must be closed before the body tag opens.

<title>: As its name suggested, it is used to add title of that HTML page which appears at the top of the browser window. It must be placed inside the head tag and should close immediately. (Optional)

<body>: Text between body tag describes the body content of the page that is visible to the end user. This tag contains the main content of the HTML document.

<h1>: Text between <h1> tag describes the first level heading of the webpage.

<p>: Text between <p> tag describes the paragraph of the webpage.

Features of HTML

- 1) It is a very **easy and simple language**. It can be easily understood and modified.
- 2) It is very easy to make an **effective presentation** with HTML because it has a lot of formatting tags.
- 3) It is a **markup language**, so it provides a flexible way to design web pages along with the text.
- 4) It facilitates programmers to add a **link** on the web pages (by html anchor tag), so it enhances the interest of browsing of the user.
- 5) It is **platform-independent** because it can be displayed on any platform like Windows, Linux, and Macintosh, etc.
- 6) It facilitates the programmer to add **Graphics, Videos, and Sound** to the web pages which makes it more attractive and interactive.
- 7) HTML is a case-insensitive language, which means we can use tags either in lower-case or upper-case.

Introduction to CSS

What is CSS?

CSS stands for Cascading Style Sheets. It is a style sheet language which is used to describe the look and formatting of a document written in markup language. It provides an additional feature to HTML. It is generally used with HTML to change the style of web pages and user interfaces. It can also be used with any kind of XML documents including plain XML, SVG and XUL.

CSS is used along with HTML and JavaScript in most websites to create user interfaces for web applications and user interfaces for many mobile applications.

What does CSS do

- You can add new looks to your old HTML documents.
- You can completely change the look of your website with only a few changes in CSS code.

Why use CSS

These are the three major benefits of CSS:

1) Solves a big problem

Before CSS, tags like font, color, background style, element alignments, border and size had to be repeated on every web page. This was a very long process. For example: If you are developing a large website where fonts and color information are added on every single page, it will become a long and expensive process. CSS was created to solve this problem. It was a W3C recommendation.

2) Saves a lot of time

CSS style definitions are saved in external CSS files so it is possible to change the entire website by changing just one file.

3) Provide more attributes

CSS provides more detailed attributes than plain HTML to define the look and feel of the website.

Introduction to JAVASCRIPT

JavaScript is a lightweight, cross-platform, and interpreted compiled programming language which is also known as the scripting language for webpages. It is well-known for the development of web pages, many non-browser environments also use it. JavaScript can be used for Client-side developments as well as Server-side developments. Javascript is both imperative and declarative type of language. JavaScript contains a standard library of objects, like Array, Date, and Math, and a core set of language elements like operators, control structures, and statements.

Client-side: It supplies objects to control a browser and its Document Object Model (DOM). Like if client-side extensions allow an application to place elements on an HTML form and respond to user events such as mouse clicks, form input, and page navigation. Useful libraries for the client-side are AngularJS, ReactJS, VueJS and so many others.

Server-side: It supplies objects relevant to running JavaScript on a server. Like if the server-side extensions allow an application to communicate with a database, and provide continuity of information from one invocation to another of the application, or perform file manipulations on a server. The useful framework which is the most famous these days is node.js.

Imperative language – In this type of language we are mostly concern about how it is to be done . It simply control the flow of computation . The procedural programming approach , object, oriented approach comes under this like async await we are thinking what it is to be done further after async call.

Declarative programming – In this type of language we are concern about how it is to be done , basically here logical computation require . Here main goal is to describe the desired result without direct dictation on how to get it like arrow function do .

JavaScript can be added to your HTML file in two ways:

Internal JS: We can add JavaScript directly to our HTML file by writing the code inside the <script> tag. The <script> tag can either be placed inside the <head> or the <body> tag according to the requirement.

External JS: We can write JavaScript code in other file having an extension.js and then link this file inside the <head> tag of the HTML file in which we want to add this code.

Introduction To MySQL DBMS

Back End Tool

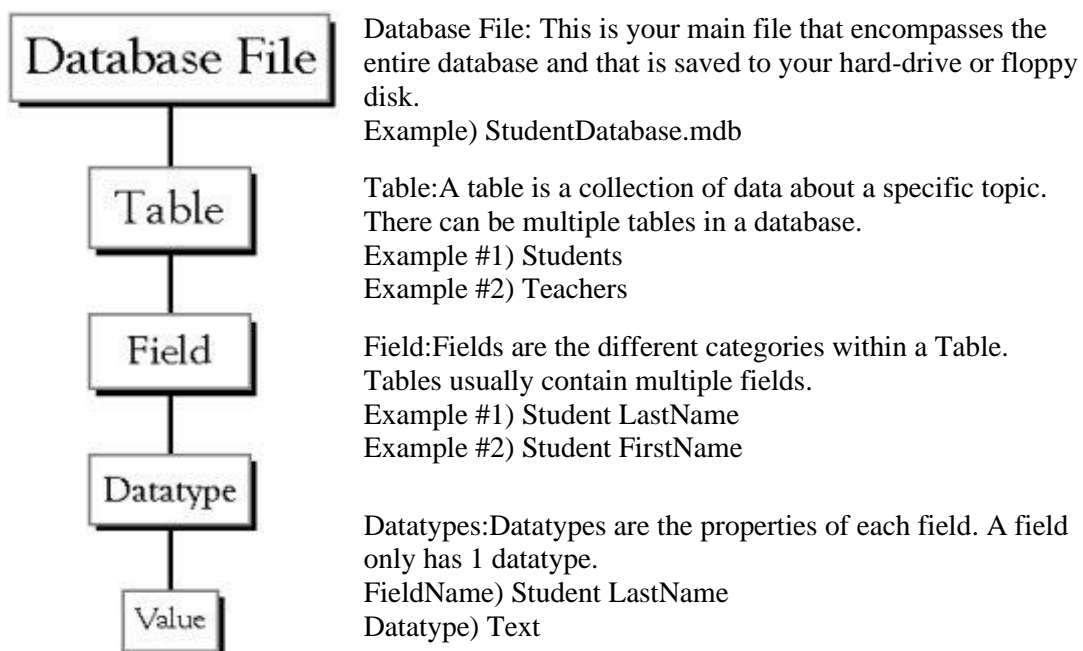

A back end is software which stores the data, manages it properly as it is designed by the user/programmer. One can store, retrieve, update or delete the data when ever needed or required. Not only can this it also retrieve the data when ever needed and as needed.

A back end tool can be a DBMS (Data Base Management System) or RDBMS (Relational Data Base Management System). A DBMS is software which allows the user to read, write and manipulate the data from the front end but it cannot allow the flexibility of establishing relations between the different tables of the back end. On establishing relations it becomes easy for the user to make regular checks for the availability of the records/values required according to the need.

An RDBMS allows storing and manipulating the data in the same manner as what a DBMS allows along with which it also gives the flexibility of establishing relations in between two or more tables on the basis of values stored in them.

Microsoft Access is a powerful program to create and manage your databases. It has many built in features to assist you in constructing and viewing your information. Access is much more involved and is a more genuine database application than other programs such as Microsoft Works.

- First of all you need to understand how Microsoft Access breaks down a database. Some keywords involved in this process are: Database File, Table, Record, Field, Data-type. Here is the Hierarchy that SQL Server uses in breaking down a database.
